

1998 Drinking Water Quality Report

RRA - LOCKETT WATER SYSTEM

Red River Authority of Texas

900 8th Street, Suite 520

Wichita Falls, Texas 76301

940/723-8697

OUR DRINKING WATER IS REGULATED

by the Texas Natural Resource Conservation Commission (TNRCC) and they have determined that certain water quality issues exist which prevent our water from meeting all of the requirements as stated in the State Drinking Water Standards. Each issue is listed in this report as a violation and we are working closely with the TNRCC to achieve solutions.

Special Notice for the ELDERLY, INFANTS, CANCER PATIENTS, people with HIV/AIDS or other immune problems:

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control and Prevention (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (800/426-4791).

Este report incluye la informacion importante sobre su aqua beber. A obtener una copia de esta informacion o traducir en Espanol, llamar

Where do we get our drinking water?

The RRA-Lockett Water System utilized Ground water from the Alluvium formation and purchased ground water from the city of Vernon. The ground water is produced through Authority owned wells located in Wilbarger County, Texas. Additional ground water is also purchased from the City of Vernon, primarily during peak demand periods. The TNRCC will be reviewing all of Texas' drinking water sources. The source water assessment process will be completed in three years.

ALL Drinking Water May Contain Contaminants

Drinking water, **including bottled water**, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800/426-4791).

Public Participation Opportunities

The Authority's Board of Directors regularly meets on the third Wednesday of January, April, July and September of each year. Specific times and locations of these and/or any special meetings can be obtained by contacting the Authority at 940/723-8697.

For more information about the water quality of your water system, public participation programs, water conservation programs and/or general operations policies, call 940/723-8697 or e-mail the Authority at: info@rra.dst.tx.us. For service request or reporting leaks after normal business hours, contact your District Manager, Mr. Mark Koch at 940/552-9420 or Mr. Jeff Christopher at 940/684-1400.

System Information

The Red River Authority of Texas owns and operates 29 registered public water supply systems through its Utility Division. The Utility Division maintains over 2,150 miles of transmission lines, two surface water treatment plants, 65 pumping facilities and serves approximately 10,000 customers residing in a 15 county area of the Red River Basin. The Utility Division is subdivided into geographical districts for proper management, maintenance and financial accounting of individual systems.

The RRA-Lockett Water System is one of the water systems operated by the Utility Division's District 13. In 1998, the system served 259 active connections with an average water use of 266 gallons per day per connection. The primary use of the water was rural domestic. No major Capital Improvement items were scheduled for 1998.

The Authority is currently upgrading the Utility Division's Water Conservation and Drought Contingency Plan. Information on the plan and its possible effects on the RRA-Lockett Water System will be provided after it is finalized.

Definitions:

Maximum Contaminant Level (MCL) -

The highest level of a contaminant in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The level of a contaminant in drinking water below which there is no known or expected health risk. MCLGs allow for a margin of safety.

Treatment Technique - A required process intended to reduce the level of a contaminant in drinking water.

Action Level - The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

NTU - Nephelometric Turbidity Units

MFL - million fibers per liter

pci/l - picocuries per liter (a measure of radioactivity)

ppm - parts per million, or milligrams per liter (mg/l)

ppb - parts per billion, or micrograms per liter (ug/l)

ppt - parts per trillion, or nanograms per liter

About the Attached Table

U.S. EPA requires water systems to test up to 97 constituents. Five constituents were detected in your water. The attached table contains all of the chemical constituents which have been found in your drinking water.

Inorganics

Year	Constituent	Highest Level at Any Sampling Point	Range of Detected Levels	MCL	MCLG	Unit of Measure	Source of Constituent
1997	Barium	0.15	0.1500-0.1500	2	2	ppm	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits.
1997	Fluoride	0.9	0.9000-0.9000	4	4	ppm	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories.
1997	Nitrate	26.45	23.1100-26.4500	10	10	ppm	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits.
1997	Selenium	4.2	4.2000-4.2000	50	50	ppb	Discharge from petroleum and metal refineries; Erosion of natural deposits; Discharge from mines.
1998	Gross alpha adjusted	4.8	4.8000-4.8000	15	0	pci/l	Erosion of natural deposits.

Lead and Copper

Year	Constituent	The 90 th Percentile	Number of Sites Exceeding Action Level	Action Level	Unit of Measure	Source of Constituent
1996	Copper	0.1200	0	1.3	ppm	Corrosion of household plumbing systems; Erosion of natural deposits; Leaching from wood preservatives.
1996	Lead	4.300	0	15	ppb	Corrosion of household plumbing systems; Erosion of natural deposits.

Violation Table

Violation	Explanation	Health Effects	Length	Steps to Correct
MCL-NITRATE	Nitrate levels were recorded at 26.45 ppm, exceeding the MCL.	Infants below the age of six months who drink water containing nitrate in excess of the MCL could become seriously ill, and, if untreated, may die. Symptoms include shortness of breath and blue baby syndrome.	1/29/79 to Present	Alternative water sources and nitrate removal treatment techniques are currently under study by the Authority.

Nitrate

(Above 5 mg/l, but below the MCL)

Nitrate in drinking water at levels above 10 ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. If you are caring for an infant you should ask advise from your health care provider.
